

Electrometer boards made by FILKAB AD

FILKAB electrometer boards are manufactured in compliance with the provisions of BDS EN 60439-1.

The board protection degree is IP44 and they can be executed for single phase and three phase voltage 50 Hz.

The boards can be customized for wall or post mounting (using suitable attaching clamps) and there is no need to dismantle the mount plate for this purpose. The electrometers and tariff (rates) changer are mounted following the circuit diagram. The input and output automatic switches are mounted on DIN bus 35/ 7.5 mm and the higher position of output switches allows the user to access them easily.

All input and output cables pass through cable inlets (union nipple) which are mounted on the board base plate. The boards are executed with two doors with the possibility for sealing the inner door by a representative of the power distribution company. A slot in the inner door makes the finger of output automatic switch accessible for the user.
